

VIEWFINITY PRIVILEGE AND SYSTEMS MANAGEMENT SOFTWARE DEPLOYMENT

Software Deployment for Laptops and Desktops

Viewfinity improves the way software and license deployment is managed. By leveraging a web-based software delivery platform, Viewfinity eliminates many of the headaches involved in everyday software delivery problems. We handle software delivery and updates for end clients that are located inside the organization as well as remote clients disconnected from the corporate network.

Software Deployment Management

The Viewfinity service-platform allows for unattended and transparent software distribution. The process is fully automated, thereby eliminating lengthy software installation and configuration projects. Using our intuitive wizard interface, software can be scheduled for targeted groups of computers either for local distribution. Deployment is enabled through our platform so IT Administrators may utilize our web service platform by having it function as the distribution point (or you may opt to use your local server). This is done through a secure and encrypted HTTPS connection. Administrators no longer have to devise special software distribution plans in order to update remote desktops and laptops that do not regularly connect to the corporate network.

Our centralized management of distributed computers enables complete control over software deployments due to transparent “on the fly” encapsulation of applications at the laptop/desktop level. Viewfinity encapsulation does not require any re-packaging or special installation procedures during the deployment process, and is completely transparent to the administrator and end user. Quite simply, any installation activities bound for the operating system are intercepted by the Viewfinity Agent. The agent then initiates encapsulation of the application or update, and installation continues in an encapsulated environment, including all application files and registry settings.

Off-Network Deployments

Delivering updates and new applications to remote machines presents a significant challenge to IT staff. For many mobile users, logging into the corporate network is an unnecessary and rare occurrence. Further, when mobile users finally do log in, they often find a backlog of required updates that take hours and several reboots to install. As a result, they may try to avoid logging on altogether.

With Viewfinity, you can deliver updates using only an Internet connection. As long as your users connect to the Internet, you can keep these machines up-to-date — even for mobile workers whose primary work location is beyond the corporate firewall.

Key Benefits and Features:

Key Benefits of Software Distribution:

- Schedules, monitors and reports on overall distribution of software
- Improves delivery to both on-network and off-network machines, ensuring all laptops and desktops are properly updated and running approved versions of applications
- Encapsulates and protects the operating system from any changes brought on by the application installation process

Key Features of Software Distribution:

- Offers flexible delivery of software through automatic scheduling to user group, departments or single user
- Distributes software from local server and web hosted service
- Encapsulates and separates the application from the OS into manageable capsules automatically
